WASEL — F3 — 24 Evaluation Conversations

Handwritten multilingual test set · FEDI hackathon

Purpose. Short, synthetic customer conversations for evaluating order intent, address level, risk flags, tone, confirmation, and language.

Data safety. Examples use placeholders for addresses and contain no real customer personal data.

Important source discrepancy. The FEDI brief requires 24 conversations, but its address-level counts sum to 22 (2 none + 4 city only + 6 area/landmark + 4 street + landmark + 6 exact). Conversation 24 is retained but marked pending clarification rather than silently changing the required counts.

Language distribution: 6 Arabizi, 6 Arabic-script Darija, 6 French, 6 Mixed. Conversation distribution: 18 orders, 4 replies after a seller question, 2 non-orders. This draft includes short conversations; seller-reply cases should be finalized with the exact preceding seller prompt before integration.

Evaluation set

01. Arabizi

Customer: nheb casque bluetooth
Customer: ena fi Sfax
Order? Yes Address level: City only
Risk flags: None Tone: Neutral
Confirmation: None Language: Arabizi

Customer: o5ti bech testalem
Order? Yes Address level: PENDING: clarify address level
Risk flags: Price hesitation; someone else receives Tone: Neutral
Confirmation: Confirmed Language: Mixed

Review notes for Omar

1. Confirm how to classify the two address-level slots missing from the source distribution. The source totals 22, not 24.

2. Identify which four conversations should be treated as replies after a seller question, and insert the actual seller question before the customer response. Do not label a conversation as a reply unless the exchange includes that context.

3. Check Tunisian phrasing and confirm all placeholder conventions before technical mapping.
